Chapter 14

Determinants of the Money Supply
The Money Supply Model

- Define money as currency plus checkable deposits: M1
- The Fed can control the monetary base better than it can control reserves
- Link the money supply ($M$) to the monetary base ($MB$) and let $m$ be the money multiplier

\[ M = m \times MB \]
Deriving the Money Multiplier I

Assume the desired level of currency $C$ and excess reserves $ER$ grows proportionally with checkable deposits $D$.

Then

$$c = \{C / D\} = \text{currency ratio}$$
$$e = \{ER / D\} = \text{excess reserves ratio}$$
Deriving the Money Multiplier II

The total amount of reserves \((R)\) equals the sum of required reserves \((RR)\) and excess reserves \((ER)\).

\[ R = RR + ER \]

The total amount of required reserves equals the required reserve ratio times the amount of checkable deposits

\[ RR = r \times D \]

Substituting for \(RR\) in the first equation

\[ R = (r \times D) + ER \]

The Fed sets \(r\) to less than 1
Deriving the Money Multiplier III

The monetary base $MB$ equals currency $(C)$ plus reserves $(R)$

$$MB = R + C = (r \times D) + ER + C$$

Reveals the amount of the monetary base needed to support
the existing amounts of checkable deposits, currency, and
excess reserves.

An increase in the monetary base that goes into currency is
not multiplied, whereas an increase that goes into supporting
deposits is multiplied.

An additional dollar of $MB$ that goes into excess reserves $ER$
does not support any additional deposits or currency
Deriving the Money Multiplier IV

\[ c = \frac{C}{D} \Rightarrow C = c \times D \text{ and} \]
\[ e = \frac{ER}{D} \Rightarrow ER = e \times D \]

Substituting in the previous equation
\[ MB = (r \times D) + (e \times D) + (c \times D) = (r + e + c) \times D \]

Divide both sides by the term in parentheses
\[ D = \frac{1}{r + e + c} \times MB \]
\[ M = D + C \text{ and } C = c \times D \]
\[ M = D + (c \times D) = (1 + c) \times D \]

Substituting again
\[ M = \frac{1+c}{r+e+c} \times MB \]

The money multiplier is then
\[ m = \frac{1+c}{r+e+c} \]
Intuition Behind the Money Multiplier

\[ r = \text{required reserve ratio} = 0.10 \]
\[ C = \text{currency in circulation} = \$400B \]
\[ D = \text{checkable deposits} = \$800B \]
\[ ER = \text{excess reserves} = \$0.8B \]
\[ M = \text{money supply (M1)} = C + D = \$1,200B \]
\[ c = \frac{\$400B}{\$800B} = 0.5 \]
\[ e = \frac{\$0.8B}{\$800B} = 0.001 \]
\[ m = \frac{1 + 0.5}{0.1 + 0.001 + 0.5} = \frac{1.5}{0.601} = 2.5 \]

This is less than the simple deposit multiplier

Although there is multiple expansion of deposits,
there is no such expansion for currency
Factors that Determine the Money Multiplier

• Changes in the required reserve ratio $r$
  ❖ The money multiplier and the money supply are negatively related to $r$

• Changes in the currency ratio $c$
  ❖ The money multiplier and the money supply are negatively related to $c$

• Changes in the excess reserves ratio $e$
  ❖ The money multiplier and the money supply are negatively related to the excess reserves ratio $e$
Factors that Determine the Money Multiplier (cont’d)

• The excess reserves ratio $e$ is negatively related to the market interest rate

• The excess reserves ratio $e$ is positively related to expected deposit outflows
Figure 1: The Excess Reserves Ratio (e) and the Interest Rate (Federal Funds Rate)

Additional Factors

• Open market operations are controlled by the Fed
• The Fed cannot determine the amount of borrowing by banks from the Fed
• Split the monetary base into two components
  • $MB_n = MB - BR \implies M = m(MB_n + BR)$
• The money supply is positively related to both the non-borrowed monetary base $MB_n$ and to the level of borrowed reserves, $BR$, from the Fed

Note: Only increases (↑) in the variables are shown. The effects of decreases on the money supply would be the opposite of those indicated in the “Money Supply Response” column.

Explaining Movements in the Money Supply

- Over long periods, the primary determinant of movements in the money supply is the nonborrowed monetary base, which is controlled by the Fed’s open market operations.
